

# Analysis summary of project EdgeR\_V8

Report generated by: robot, Thu Nov 15 17:11:00 CST 2018  
using RobiNA version 1.2.4\_build656

The analysis was run using count data imported from a precomputedcounts table file:  
APEX5\_Hiseq\_Hisat\_Counts\_V8.txt

Between the samples defined in the imported counts table, the following contrastshave been computed:

*GCShootCOL00-FLShootCOL00*  
*GCShootCAX23-FLShootCAX23*  
*GCShootCAX22-FLShootCAX22*  
*GCShootRBOHD-FLShootRBOHD*  
*GCRootCAX23-FLRootCAX23*  
*GCRootRBOHD-FLRootRBOHD*  
*GCRootCOL00-FLRootCOL00*  
*GCRootCAX22-FLRootCAX22*

The normalization and statistical evaluation of differential gene expression has been performed using edgeR (Robinson et al., 2010) with a p-value cut-off of 0.05 and using the Benjamini-Hochberg (1995) method for multiple testing correction.

The raw data was normalized according to the default procedure of the differential expression analysis package used. The dispersion was estimated using the auto setting

## MA plots of each comparison

The MA plots show the log<sub>2</sub> fold change (M; logFC) plotted versus the average expression strength (A; LogConc) for each of the comparisons that was computed. Usually, these scatter plots show a trumpet-like shape which is attributed to the fact that genes with a lower expression signal strength are more strongly affected by noise than strongly expressed genes.

According to the assumption that under most experimental conditions the bulk of the genes of an organism are not responding differentially, the cloud of points should be centered around a log fold change of 0. Genes that were called significantly differentially expressed are shown in red.

**MA plot of contrast GCRotCAX22-FLRootCAX22**

MA plot of contrast GRootCAX23-FLRootCAX23

MA plot of contrast GCRootCOL00-FLRootCOL00

MA plot of contrast GCRootRBOHD-FLRootRBOHD

MA plot of contrast GCShootCAX22-FLShootCAX22

MA plot of contrast GCShootCAX23-FLShootCAX23

MA plot of contrast GCShootCOL00-FLShootCOL00

MA plot of contrast GCShootRBOHD-FLShootRBOHD

## Venn Diagrams

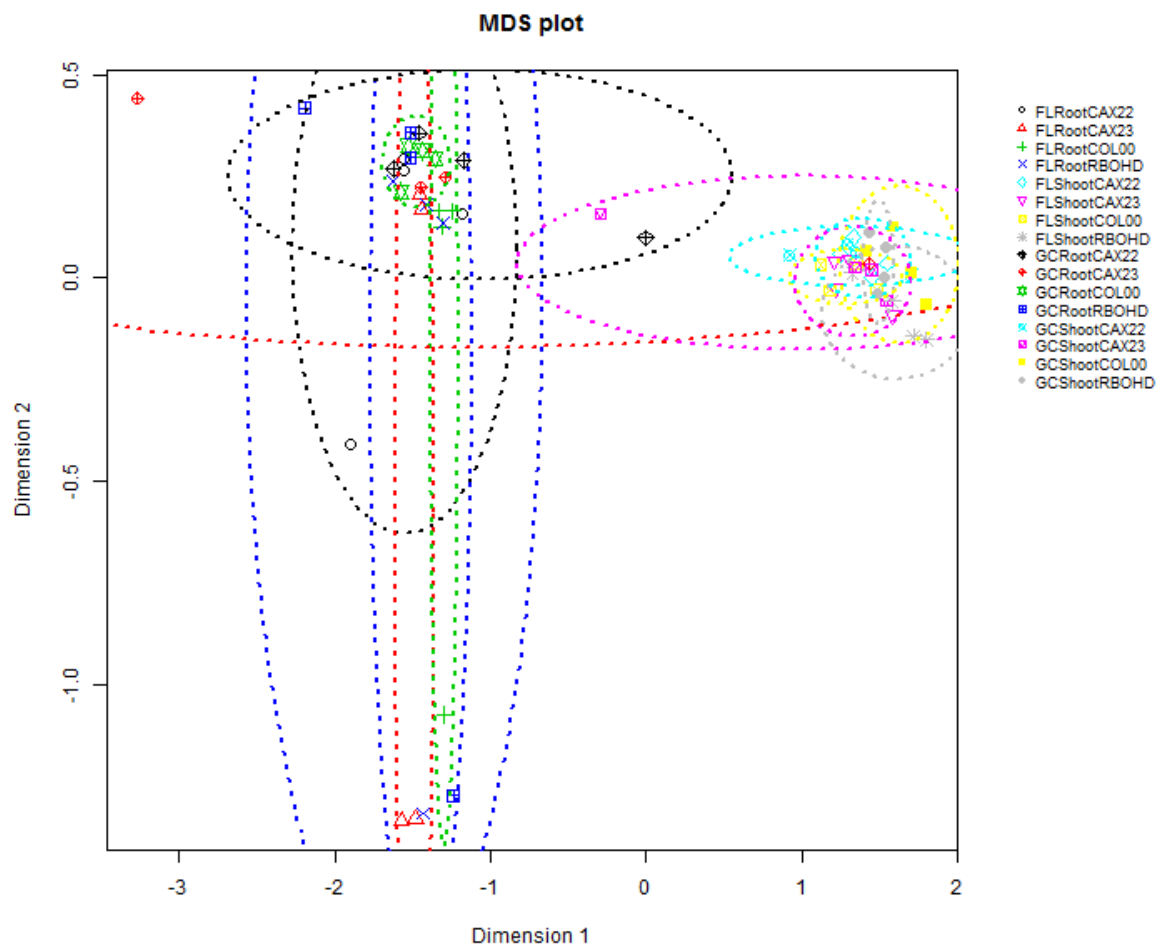

Venn diagrams visualize the amount of genes that were called significantly differentially expressed in each comparison. The conditions are represented by circles. Genes that show a significant response to more than one condition are plotted in the overlapping areas while the amount of not significantly changed genes is given in the lower right corner of the plots.

Venn diagrams allow a simple and quick overview of the impact of the treatments on the gene expression profile and also the specificity of the responses

## Multi-dimensional scaling (MDS) plot

The MDS or principal coordinate plot visualizes the distances between the RNA-Seq libraries in the experiment. To compute the points, a set of 500 tags(genes) that have the largest variation between the libraries (i.e. the largest tagwise dispersion when treating all libraries as one experimental group) is selected. The distance between each pair of libraries is equivalent to the square root of the common dispersion between these two libraries (using the top 500 genes).

Hence, the MDS plot gives an insight into the structure of the experiment - libraries that were generated on biological replicates of the same treatment should cluster together

**Top differentially expressed genes: full\_table\_GCRootCAX22-FLRootCAX22.txt**
